Basic IQX CV Searching using Microsoft Indexing Services

Searching is much quicker when the search terms are all included in one CV criteria box on the search screen. For every seperate instance of the criteria of CV being included in the search, IQX has to search the entire database and save the results in a separate table for each one before searching again. By combining words in one instance of the CV search criteria, CVs are only searched once and the search will be much more efficient.

The below two examples return the same list of matching candidates.

Example 1 takes around six seconds to return, Example 2 takes almost two minutes to return the same results.
