IQXanywhere Backup and Data Retention Policy

- A ‘standby’ copy of your database is maintained on a separate recovery server. A continuous log backup is run and applied to the standby database every few minutes, so that in the event of primary server failure the database can be restored up to the minute.
- Every evening a complete backup of the database log is made and applied to the standby database. This keeps the primary server tidy and restarts the continuous log backup. At this point the standby database is validated to ensure that it is free of errors.
- Each of the above steps is duplicated into a separate safe copy folder on the recovery server.
- Once a week a new safe copy folder is started – the previous two are retained.
- Every (?week ?day) the current safe copy folder is encrypted and uploaded to ????
