Configuring single sign-on / Active Directory integration

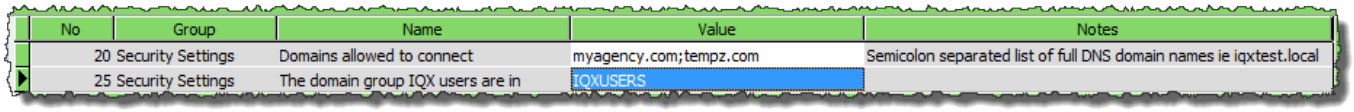

Introduction

It is now possible to log into IQX using Active Directory authentication. Provided a user has the required permissions and security setup, clicking on the IQX icon will log the user straight in to IQX without having to complete the login box.

Where the user does not have rights to use an integrated log in or there is an error with the Active Directory setup, the user will be presented with standard login dialog box.

To Configure in IQX

To set up IQX to permit silent login enter the required domain information into General settings – Security settings 20 and 25.

No	Group	Name	Value	Notes
20	Security Settings	Domains allowed to connect	myagency.com;tempz.com	Semicolon separated list of full DNS domain names ie iqxtest.local
25	Security Settings	The domain group IQX users are in	IQXUSERS	

- **Domains allowed to connect** list (separated by semicolons) the domains you wish to allow integrated logins from.
- **Domain group** The active Directory group that controls access to IQX

To Configure in Active Directory

Set up a group in Active Directory, and make authorised users of IQX members of that group.

Using Integrated Logins
